Chapter 4

Data Structure Documentation

4.1 PhysListEmStandard Class Reference

```
#include <PhysListEmStandard.hh>
```

Inheritance diagram for PhysListEmStandard:

Collaboration diagram for PhysListEmStandard:

Public Member Functions

- [PhysListEmStandard](#) (const G4String &name="standard")
Constructor.
- [~PhysListEmStandard](#) ()
- void [ConstructParticle](#) ()
This method is dummy for physics.
- void [ConstructProcess](#) ()

4.1.1 Detailed Description

Header for Electromagnetic Interactions Physics List EmStandard is used

Author

Nikolaos Karastathis < nkarast .at. cern .dot. ch >

Version

v2.0

4.1.2 Constructor & Destructor Documentation

4.1.2.1 PhysListEmStandard::PhysListEmStandard (const G4String & name = "standard")

Constructor.

Source for

See also

[PhysListEmStandard](#) (Shamelessly copied from a G4 example)

Author

Nikolaos Karastathis <nkarast.at.cern.dot.ch>

Version

v2.0

4.1.2.2 `PhysListEmStandard::~~PhysListEmStandard ()`

4.1.3 Member Function Documentation

4.1.3.1 `void PhysListEmStandard::ConstructParticle ()` `[inline]`

This method is dummy for physics.

4.1.3.2 `void PhysListEmStandard::ConstructProcess ()`

This method will be invoked in the `Construct()` method. each physics process will be instantiated and registered to the process manager of each particle type

The documentation for this class was generated from the following files:

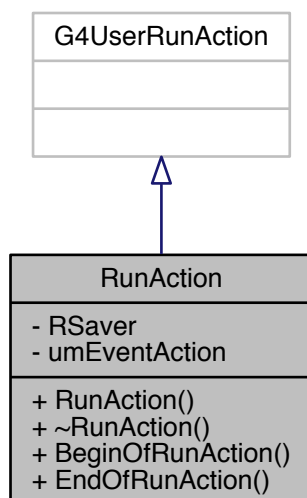

- [include/PhysListEmStandard.hh](#)
- [src/PhysListEmStandard.cc](#)

4.2 RunAction Class Reference

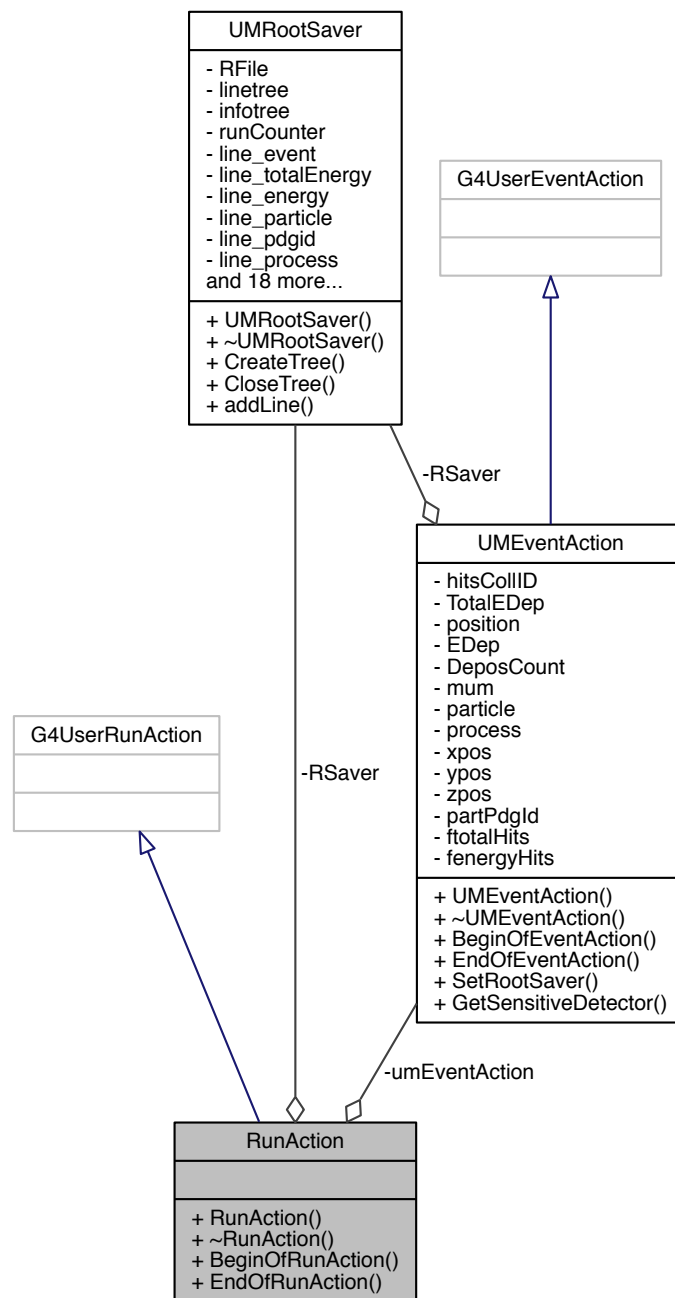

The user-defined Run action class At the.

```
#include <RunAction.hh>
```

Inheritance diagram for RunAction:

Collaboration diagram for RunAction:

Public Member Functions

- [RunAction](#) ([UMEventAction](#) *evAct)
Constructor.
- virtual [~RunAction](#) ()
Destructor.
- void [BeginOfRunAction](#) (const G4Run *)

At the beggining of each Run execute these statements.

- void [EndOfRunAction](#) (const G4Run *)

When the Run ends execute these statements.

Private Attributes

- [UMRootSaver](#) *RSaver*

Link the run with the.

- [UMEventAction](#) * *umEventAction*

Link to the to the.

4.2.1 Detailed Description

The user-defined Run action class At the.

See also

[BeginOfRunAction](#) a RootSaver object is created to store the information

4.2.2 Constructor & Destructor Documentation

4.2.2.1 RunAction::RunAction (UMEventAction * *theEventAction*)

Constructor.

Source for

See also

[RunAction](#)

Author

Nikolaos Karastathis < nkarast .at. cern .dot. ch >

Version

v2.0

Create an instance of RootSaver

4.2.2.2 virtual RunAction::~~RunAction () [inline],[virtual]

Destructor.

4.2.3 Member Function Documentation

4.2.3.1 void RunAction::BeginOfRunAction (const G4Run * *aRun*)

At the beggining of each Run execute these statements.

At the start of the Run create the ROOT trees. For each run a new TTree is created, with default names

4.2.3.2 void RunAction::EndOfRunAction (const G4Run * *aRun*)

When the Run ends execute these statements.

at the end of a run print out some info

4.2.4 Field Documentation

4.2.4.1 UMRotSaver RunAction::RSaver [private]

Link the run with the.

See also

[UMRotSaver](#) object (
[RSaver](#))

4.2.4.2 UMEventAction* RunAction::umEventAction [private]

Link to the to the.

See also

[UMEventAction](#)

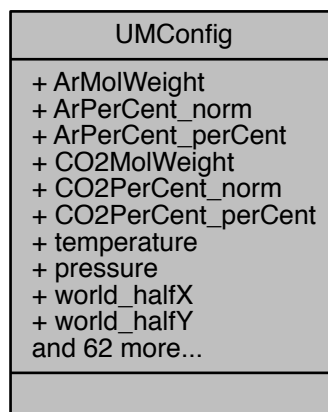

The documentation for this class was generated from the following files:

- [include/RunAction.hh](#)
- [src/RunAction.cc](#)

4.3 UMConfig Struct Reference

```
#include <UMConfig.hh>
```

Collaboration diagram for UMConfig:

Data Fields

- G4double [ArMolWeight](#) = 39.948

4.4.2.2 UMDetectorConstruction::~~UMDetectorConstruction ()

Destructor.

4.4.3 Member Function Documentation

4.4.3.1 G4double UMDetectorConstruction::calculateDensity (G4double *molWeightA*, G4double *perCentA*, G4double *molWeightB*, G4double *perCentB*)

Calculates the density of a mixture of gasses given the relative molecular weight and the percentage.

user defined function to find the density of a gas mixture mg/cm3

4.4.3.2 G4VPhysicalVolume * UMDetectorConstruction::Construct ()

Construct the detector!

4.4.3.3 G4VPhysicalVolume * UMDetectorConstruction::ConstructDetector () [private]

Construct the detector.

Define some sizes, for the user to change:

this makes the software slower but checks for overlaps during debugging phase

define rotations

define gas volumes

4.4.3.4 void UMDetectorConstruction::DefineMaterials () [private]

a : standard atomic weight, z : atomic number

elements

materials

Get nist material manager

epoxy is glue

and graphite

print out the Material table

Version

v2.0

4.8.1.2 UMPPrimaryGeneratorAction::~~UMPPrimaryGeneratorAction () [virtual]

4.8.2 Member Function Documentation

4.8.2.1 void UMPPrimaryGeneratorAction::GeneratePrimaries (G4Event * *anEvent*)

Attention

{CAREFULL ABOUT THE Y POSITION HERE! – This is set for ANGULAR BEAMS!}

the particle gun is particleGun_Xdistance away from the CENTER of the detector but the maximum opening distance would be aquired if we calculate the angles with respect to the first frame that the particle impacts ==>> to calculate the angles we subtract the half_width of the detector

set the momentum of X-axis towards the negative direction

now that everything is setup generate an event!

Version

v2.0

{'collectionName' is a protected data member of base class G4VSensitiveDetector. Here we declare the name of the collection we will be using.}

{Note that we may add as many collection names we would wish: ie

4.10.3.2 `UMSD::~~UMSD () [inline]`

4.10.4 Member Function Documentation

4.10.4.1 `void UMDS::EndOfEvent (G4HCofThisEvent * HCE)`

defines what happens at the end of each event.

do nothing -

See also

`EndOfEventAction` will take care of that

4.10.4.2 `void UMDS::Initialize (G4HCofThisEvent * HCE)`

To insert the collection, we need to get an index for it. This index is unique to the collection. It is provided by the `GetCollectionID(...)` method (which calls what is needed in the kernel to get this index).

4.10.4.3 `G4bool UMDS::ProcessHits (G4Step * step, G4TouchableHistory * ROhist)`

Mandatory class.

Get the track for the step

Generate the info for this track (position, energy, particle, etc)

Generate a new [UMHit](#) and store the information

then insert the hit into the Hits Collection

4.10.5 Field Documentation

4.10.5.1 `G4int UMDS::HCID [private]`

Collection of hits in the gas.

4.10.5.2 `hitMap_t UMDS::hitMap [private]`

Helper mapping layer number with hit.

4.10.5.3 `UMHitsCollection* UMDS::hitsCollection [private]`
